Economic, Environmental and Financial Analyses of Small-Scale Distributed Hydrogen Generation Alternatives

> Laura E. Verduzco Environmental and Energy Management Program The George Washington University 2004

Background (1/5)

Urgent need to find a way to keep supplying energy to our homes and automobiles without jeopardizing our health and natural resources

The most promising solution? Hydrogen: clean, efficient, and can be obtained from several sources

Primary Energy Consumption by Sector in quads (Source: Energy Information Administration)

Background (2/5)

- Recent heavy investment in hydrogen technology by government, automobile manufacturers, petrochemical companies and others
- Hydrogen fueled vehicles being tested

What is available now?

GenSys stationary fuel cell (Source: Plugpower Fuel Cell Systsms)

Fuel cells for residential and light domestic applications
Back-up power systems
Other applications

Background (3/5)

Home Energy Station Prototype

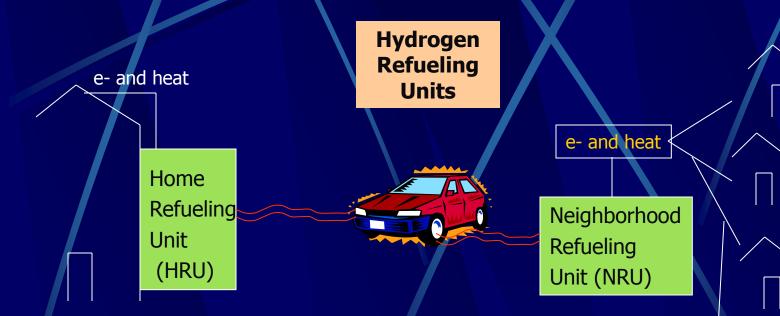

Solar powered water electrolyzing hydrogen station

Cogeneration station to meet the electricity, heating, and hot water needs of typical Japanese homes

Background (4/5)

HRU: Generation of clean electricity and heat for a single family home + hydrogen to fuel at least one vehicle

NRU: more powerful and capable of providing clean electricity and heat for a neighborhood + hydrogen for transportation for a number of cars

Background (5/5)

A Hydrogen Refueling Unit consists of:

- Power source: renewable / non-renewable
- Fuel processor: reforming / electrolysis
- ✓ Fuel cell stack: PEMFC / SOFC, etc.
- ✓ Air management system
- Water and thermal management system
- ✓ Storage system
- Ancillary components

Problem Statement

National Academy of Engineering (2004): "...in the committee's vision of a possible hydrogen future, the demand for hydrogen will likely be met using distributed production during the first couple of decades of transition."

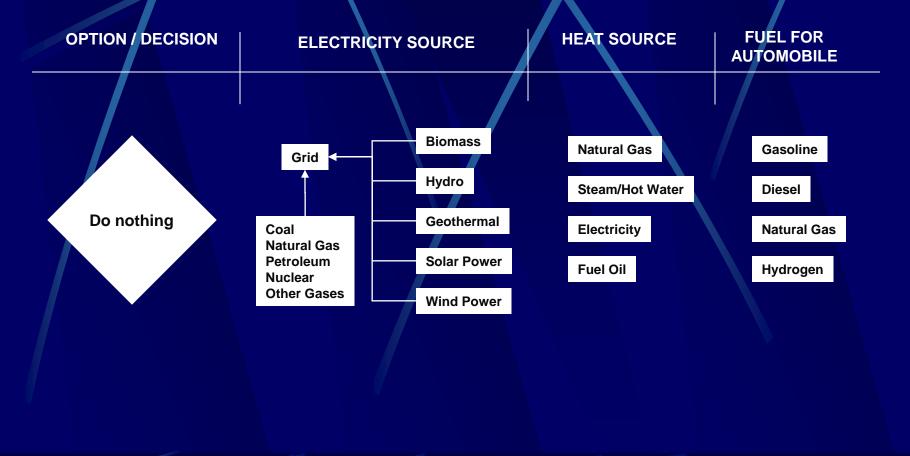

Chicken and egg problem:

- Develop hydrogen demand facilities to pull demand?
- Develop hydrogen infrastructure to encourage use?

Solution: Analysis of Small Scale Generation

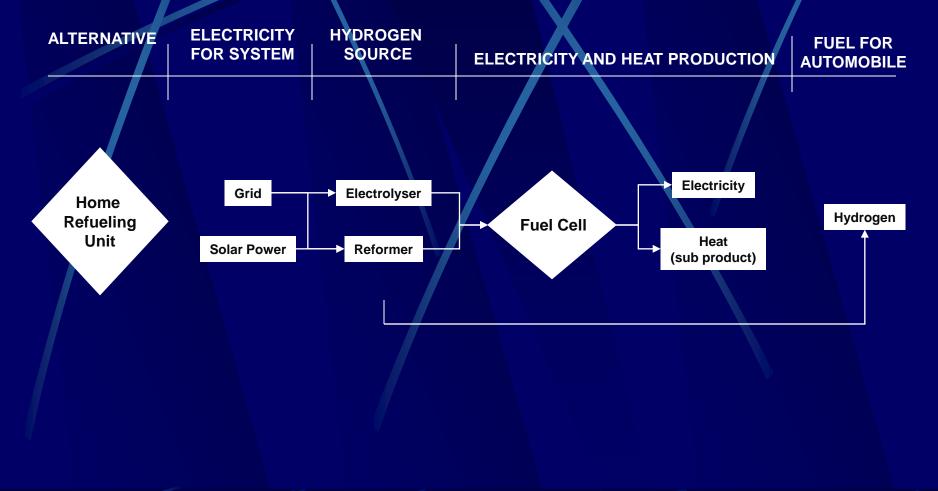

Start at small scale: residential units and distributed generation Engineering/economic analyses of three energy production alternatives: Conventional (baseline) □ Home Refueling Units Neighborhood/Community Refueling Units

Alternative 1: Conventional Sources

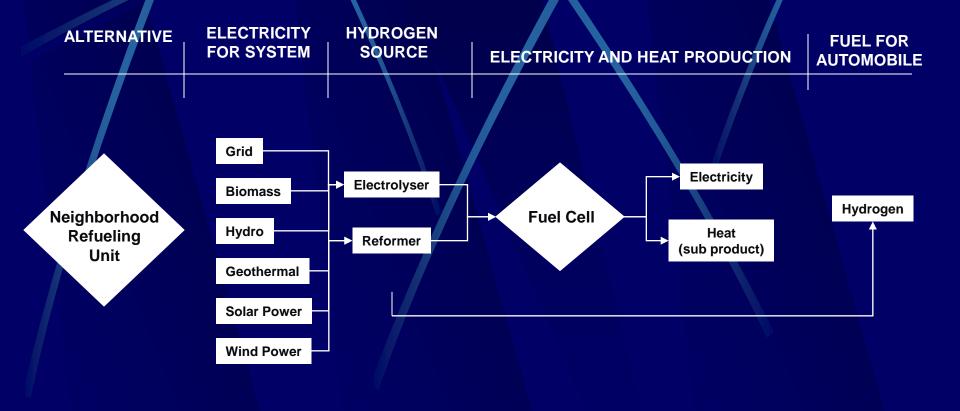

| OPTION ONE: CONVENTIONAL | SOURCES OF | ENERGY | | | | | | |

Offer \$1500 in tax credits?

This is what the developer pays

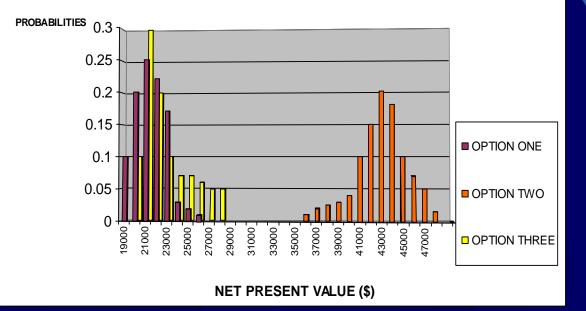

How can we make options two and three more attractive for the developer? Economic incentives: tax credits, subsidies...

Sensitivity Analysis

Comparison of NPVs Using Simulation

MONTE CARLO SIMULATIONS

Calculate multiple scenarios by repeatedly sampling values from the probability distributions

Value of the research

- <u>To government</u>: Will provide a solid basis for recommending financial schemes that encourage the utilization of cleaner technologies
- To automobile manufacturers: Will enable forecasting and evaluation of the financial viability of interconnections between hydrogen production and end use
- To developers: Will enable comparisons of present and projected net worth and financial parameters
- To all users: Will allow projections to be easily modified and refined in a user friendly way as new information becomes available
